This report sets forth our findings solely with respect to the test samples identified herein. The results set forth in this report are not indicative or representative of the quality or characteristics of the lot from which a test sample was taken or any similar or identical product unless specifically and expressly noted. Our report includes all of the tests requested by you and the results thereof based upon the information that you provided to us. You have 60 days from date of issuance of this report to notify us of any material error or omission caused by our negligence, provided, however, that such notice shall be in writing and shall specifically address the issue you wish to raise. A failure to raise such issue within the prescribed time shall constitute your unqualified acceptance of the completeness of this report, the tests conducted and the correctness of the report contents. Unless specific mention, the uncertainty of measurement has been explicitly taken into account to declare the compliance or non-compliance to the specification.

The report must not be used by the client to claim product certification, approval, or endorsement by any government agencies

1 Certificate of Conformity

Product: Mini Macro Outdoor Pico BTS

Brand: Nokia

Test Model: FW2CA

Sample Status: MASS-PRODUCTION

Applicant: Nokia Solutions and Networks

Test Date: Aug. 24, 2017

Standards: FCC Part 90, Subpart S

FCC Part 2

The above equipment has been tested by **Bureau Veritas Consumer Products Services (H.K.) Ltd., Taoyuan Branch**, and found compliance with the requirement of the above standards. The test record, data evaluation & Equipment Under Test (EUT) configurations represented herein are true and accurate accounts of the measurements of the sample's EMC characteristics under the conditions specified in this report.

2.1 Measurement Uncertainty

Where relevant, the following measurement uncertainty levels have been estimated for tests performed on the EUT as specified in CISPR 16-4-2:

| Measurement | Frequency | Expanded Uncertainty (k=2) (±) |
|--------------------------------|-----------------|--------------------------------|
| Radiated Emissions up to 1 GHz | 30MHz ~ 200MHz | 5.32 dB |
| | 200MHz ~1000MHz | 5.14 dB |
| Radiated Emissions above 1 GHz | 1GHz ~ 18GHz | 5.04 dB |
| Radiated Emissions above 1 GHZ | 18GHz ~ 40GHz | 5.25 dB |

4. The EUT uses following internal power supply.

| Brand | GE |
|--------------|-------------|
| Model | CLP0412 |
| Input Power | 90 - 264Vac |
| Output Power | 12Vdc |

5. The EUT must be inserted with one module as following table:

| Product Name | Brand | Model No. | FCC ID |
|--------------|-------|-----------|-------------|
| BT module | Nokia | NBTM01 | 2AD8UNBTM01 |

6. The above EUT information is declared by manufacturer and for more detailed features description, please refer to the manufacturer's specifications or user's manual.

3.3 Test Mode Applicability and Tested Channel Detail

Pre-Scan has been conducted to determine the worst-case mode from all possible combinations between available modulations, data rates. Following channel(s) was (were) selected for the final test as listed below:

| Test Item | Available Frequency (MHz) | Tested Frequency (MHz) | Channel Bandwidth | Modulation |
|---------------------------------|------------------------------|------------------------|----------------------|-------------------------------|
| Output Power | 864.1~867.5 | 864.1/ 865.8/ 867.5 | 3MHz | QPSK, 16QAM, 64QAM, 256QAM |

3.4 EUT Operating Conditions

The software (telnet pasted command.txt) provided by client to enable the EUT to export maximum output power under transmission mode and specific channel frequency.

3.5 General Description of Applied Standards

The EUT is a RF Product. According to the specifications of the manufacturer, it must comply with the requirements of the following standards:

FCC 47 CFR Part 2

FCC 47 CFR Part 90

KDB 971168 D01 Power Meas License Digital Systems v02r02

KDB 662911 D01 Multiple Transmitter Output v02r01

ANSI/TIA/EIA-603-D 2010

All test items have been performed and recorded as per the above standards.

Report No.: RF160802E01B Page No. 13 / 69 Report Format Version: 6.1.1

4 Test Types and Results

4.1 Output Power Measurement

4.1.1 Limits of Output Power Measurement and Antenna Height

The effective radiated power shall be according to the specific rule Part 90.635 that "The effective radiated power and antenna height for base stations may not exceed 1 kilowatt (30 dBW) and 304 m.(1,000 ft.) above average terrain (AAT), respectively, or the equivalent thereof as determined from the Table. These are maximum values, and applicants will be required to justify power levels and antenna heights requested.".

| Antenna height (ATT) meters (feet) | Effective radiated power (watts) |
|--------------------------------------|----------------------------------|
| Above 1,372 (4,500) | 65 |
| Above 1,220 (4,000) to 1,372 (4,500) | 70 |
| Above 1,067 (3,500) to 1,220 (4,000) | 75 |
| Above 915 (3,000) to 1,067 (3,500) | 100 |
| Above 763 (2,500) to 915 (3,000) | 140 |
| Above 610 (2,000) to 763 (2,500) | 200 |
| Above 458 (1,500) to 610 (2,000) | 350 |
| Above 305 (1,000) to 458 (1,500) | 600 |
| Up to 305 (1,000) | 1,000 |

4.1.2 Test Procedures

EIRP / ERP Measurement:

- a. The EUT was set up for the maximum power with LTE link data modulation. The power was measured with power meter. All measurements were done at low, middle and high operational frequency range.
- b. The average power meter was used to perform RF output power measurements, the fundamental condition that measurements be performed only over durations of active transmissions at maximum output power level applies. If the EUT cannot be configured to transmit continuously (i.e., burst duty cycle < 98%), then the gated average power meter was used to perform the measurement if the gating parameters can be adjusted such that the power is measured only during active transmission bursts at maximum output power levels.</p>
- c. Relevant equation for determining the maximum ERP or EIRP from the measured RF output power is given in Equation as follows:

ERP or EIRP = PMeas + GT

Where

ERP or EIRP effective radiated power or equivalent isotropically radiated power, respectively (expressed in the same units as PMeas, e.g., dBm or dBW)

PMeas measured transmitter output power, in dBm or dBW

GT gain of the transmitting antenna, in dBd (ERP) or dBi (EIRP)

4.2 Frequency Stability Measurement

4.2.1 Limits of Frequency Stability Measurement

1.5 ppm is for base and fixed station. 2.5 ppm is for mobile station.

4.2.2 Test Procedure

- a. Device is placed at the oven room. The oven room could control the temperatures and humidity. Power warm up is at least 15 min and power applied should perform before recording frequency error.
- b. EUT is connected the external power supply to control the AC input power. The test voltage range is from minimum to maximum working voltage. Each step shall be record the frequency error rate.
- c. The temperature range step is 10 degrees in this test items. All temperature levels shall be hold the ± 0.5 °C during the measurement testing. The each temperature step shall be at least 0.5 hours, consider the EUT could be test under the stability condition.

4.3 Occupied Bandwidth Measurement

4.3.1 Limits of Occupied Bandwidth Measurement

The width of a frequency band such that, below the lower and above the upper frequency limits, the mean powers emitted are each equal to a specified percentage 0.5 %of the total mean power of a given emission.

4.3.2 Test Procedure

The EUT makes a call to the communication simulator. All measurements were done at low, middle and high operational frequency range, RB of the spectrum is 1% of occupied bandwidth and VB of the spectrum is 3 times RBW. The communication simulator station system controlled a EUT to export maximum output power under transmission mode and specific channel frequency. Use OBW measurement function of Spectrum analyzer to measure 99 % occupied bandwidth.

4.4 Emission Mask Measurement

4.4.1 Limits of Emission Mask Measurement

Per 90.210, equipment used in 809-824/854-869 MHz licensed band to EA or non-EA systems shall comply with the emission mask provisions of §90.691.

Per 90.691, Emission mask requirements

- (a) Out-of-band emission requirement shall apply only to the "outer" channels included in an EA license and to spectrum adjacent to interior channels used by incumbent licensees. The emission limits are as follows:
- (1) For any frequency removed from the EA licensee's frequency block by up to and including 37.5 kHz, the power of any emission shall be attenuated below the transmitter power (P) in watts by at least 116 Log10(f/6.1) decibels or 50 + 10 Log10(P) decibels or 80 decibels, whichever is the lesser attenuation, where f is the frequency removed from the center of the outer channel in the block in kilohertz and where f is greater than 12.5 kHz.
- (2) For any frequency removed from the EA licensee's frequency block greater than 37.5 kHz, the power of any emission shall be attenuated below the transmitter power (P) in watts by at least 43 + 10Log10(P) decibels or 80 decibels, whichever is the lesser attenuation, where f is the frequency removed from the center of the outer channel in the block in kilohertz and where f is greater than 37.5 kHz.
- (b) When an emission outside of the authorized bandwidth causes harmful interference, the Commission may, at its discretion, require greater attenuation than specified in this section.

Note:

This device can be implement MIMO function, so the limit of spurious emissions needs to be reduced by 10log(Numbers_{Ant}) according to FCC KDB 662911 D01 guidance.

{The limit is adjusted to -13dBm - 10*log(2) = -16.01dBm and -20dBm-10*log(2) = -23.01dBm.}

4.4.2 Test Procedures

- 1. The power was measured with Spectrum Analyzer. All measurements were done at 1 channel.
- 2. The measurement used the power splitter via EUT RF power connector between signal generator and spectrum analyzer.
- 3. Record the test plot.

4.5 Peak to Average Ratio

4.5.1 Limits of Peak to Average Ratio Measurement

In measuring transmissions in this band using an average power technique, the peak to-average ratio (PAR) of the transmission may not exceed 13 dB

4.5.2 Test Setup

4.5.3 Test Procedures

- a. Set resolution/measurement bandwidth ≥ signal's occupied bandwidth;
- b. Set the number of counts to a value that stabilizes the measured CCDF curve;
- c. Record the maximum PAPR level associated with a probability of 0.1%.

4.6 Conducted Spurious Emissions

4.6.1 Limits of Conducted Spurious Emissions Measurement

The power of any emission outside a licensee's frequency block shall be attenuated below the transmitter power (P) by at least 43 +10 log10(P) dB. The limit of emission equal to -13dBm.

Note:

This device can be implement MIMO function, so the limit of spurious emissions needs to be reduced by 10log(Numbers_{Ant}) according to FCC KDB 662911 D01 guidance.

{The limit is adjusted to -13dBm - 10*log(2) = -16.01dBm.}

4.6.2 Test Setup

4.6.3 Test Procedure

- a. The EUT was set up for the maximum peak power with LTE link data modulation. The power was measured with Spectrum Analyzer.
- b. The conducted spurious emission used the power splitter via EUT RF power connector between signal generator and spectrum analyzer.
- c. When the spectrum scanned from 9kHz to 9GHz, it shall be connected to the band reject filter attenuated the carried frequency. The spectrum set RB=100kHz, VB=300kHz for below 1GHz and RB=1MHz, VB=3MHz for above 1GHz test.

4.7 Radiated Emission Measurement

4.7.1 Limits of Radiated Emission Measuremen

The power of any emission outside a licensee's frequency block shall be attenuated below the transmitter power (P) by at least 43 +10 log10(P) dB. The limit of emission equal to -13dBm

4.7.2 Test Procedure

- a. Substitution method is used for EIRP measurement. In the semi-anechoic chamber, EUT placed on the 0.8m height of Turn Table, rotated the table around 360 degrees to search the maximum radiation power and receiver antenna shall be rotated vertical and horizontal polarization and moved height from 1m to 4m to find the maximum polar radiated power. The "Read Value" is the spectrum reading the maximum power value.
- b. The substitution antenna is substituted for EUT at the same position and signals generator export the CW signal to the substitution antenna via a TX cable. Rotated the Turn Table and moved receiving antenna to find the maximum radiation power. Adjust output power level of S.G to get a Value of spectrum reading equal to "Read Value" of step a. Record the power level of S.G
- c. EIRP = Output power level of S.G TX cable loss + Antenna gain of substitution antenna.
- d. ERP power can be calculated form EIRP power by subtracting the gain of dipole, ERP power = EIRP power 2.15dBi.

NOTE: The resolution bandwidth and video bandwidth of test receiver/spectrum analyzer is 1MHz/3MHz.

4.7.3 Deviation from Test Standard
